Regarding independent claims 68, 76, 77, 73, 74, and 78, the prior art of record, or that encountered during search by the examiner, fails to anticipate, or suggest the claimed provision of evaluating a collection of data represented by an interlocking trees data store situated within active memory accessible to a process running in a computer, said interlocking trees data store

Art Unit: 2164

comprising a plurality of K paths having a structured collection of nodes connected by links of said nodes having pointers to other nodes of said interlocking trees data store, wherein said nodes contain a count field, said nodes including at least nominally different kinds of nodes, a first kind called root nodes of which there are at least one primary root node and at least one elemental root node and which may include other root nodes, a second kind of node called an end of thought node, at least one node of a third kind of node called a subcomponent node, and at least one node of a kind of node called an end product node, and wherein there exist at least two kinds of said links, as Result and as case links, wherein said as Result links point between a one of said root nodes and any other node, and wherein said as case links point between said at least one primary root node and at least one said end product node and include in a K path between said end product node and said primary root node at least one said subcomponent node said method comprising the steps of: traversing at least one K path of said plurality of K paths using at least one link of said as Result links or said as case links; determining a K context within said data store in accordance with said traversing of said at least one K path; determining a position along each K path of said K context; determining a focus within said K context and its corresponding focus value; calculating a probability of an occurrence of said focus between said position and said end product node along at least one K path within said K context; and providing said probability of said occurrence of said focus between said position and the end product along the K path within said K context to said process running in said computer., in conjunction with remaining claim provisions.

The dependent claims 32-67, 69-72, and 75, being further limiting to the independent claims, definite and enabled by the Specification are also allowed.
